

1.0A FAST ULTRA LOW DROPOUT LINEAR REGULATOR

■ DESCRIPTION

The UTC **LR1801/LR1801AD** operate from a +1.5V ~ +6V input supply as fast ultra low-dropout linear regulators. Wide output voltage range options are available. The fast response characteristic to make UTC **LR1801/LR1801AD** suitable for low voltage microprocessor application. The low quiescent current operation and low dropout quality caused by the CMOS process.

The UTC **LR1801/LR1801AD** has low dropout voltage. The ground pin current is typically 60uA.

The output voltage types of UTC **LR1801-xx** are fixed one in the IC and UTC **LR1801AD** are adjustable one.

■ FEATURES

- * Low Dropout Voltage
- * The Guaranteed Output Current is 1A DC
- * Fixed Output Voltage Accuracy ± 1%
- Adjustable Output Voltage Accuracy ± 2%
- * Over temperature Protection And Over current Protection

Thermal Shutdown release temperature	T _{SR}	Junction temperature		120		°C

Notes: 1. The UTC **LR1801** output must be diode-clamped to ground. If used in a dual-supply system where the regulator load is returned to a negative supply.

2. Devices must be derated based on package thermal resistance at elevated temperatures.

3. V_{OUT(S)}: Specified output voltage

V_{OUT(E)}: Actual output voltage

Output voltage when fixing I_{OUT}(=100mA) and inputting V_{OUT(S)}+1.0V

4. V_{drop}=V_{IN1}-(V_{OUT3}×0.98)

V_{OUT3} is the output voltage when V_{IN}=V_{OUT(S)}+1.0V and I_{OUT}=300mA, 1000mA.

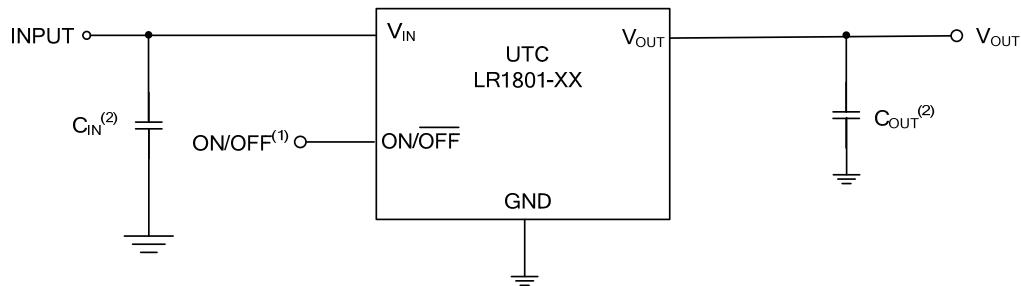

5. The output current at which the output voltage becomes 95% of V_{OUT(E)} after gradually increasing the output current.

6. The output current can be at least this value.

Due to restrictions on the package power dissipation, this value may not be satisfied. Attention should be paid to the power dissipation of the package when the output current is large.

This specification is guaranteed by design.

■ TYPICAL APPLICATION CIRCUIT

Fixed Output Voltage

(1) ON/OFF pins must be pulled high through a 10kΩ pull-up resistor.

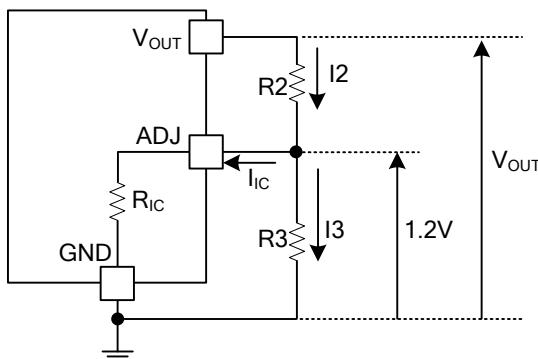

(2) Generally a series regulator may cause oscillation, depending on the selection of external parts. The following conditions are recommended for this IC. However, be sure to perform sufficient evaluation under the actual usage conditions for selection, including evaluation of temperature characteristics.

Input capacitor (C_{IN}): 2.2μF or more

Output capacitor (C_L): 2.2μF or more

■ TYPICAL APPLICATION CIRCUIT (Cont.)

Adjustable Output Voltage

The Output Voltage may be adjustable for any output voltage between its 1.2V reference and its V_{DD} setting level. An external pair of resistors is required, as shown above.

The complete equation for the output voltage is described step by step as follows;

$$I_2 = I_{IC} + I_3 \quad (1)$$

$$I_3 = 1.2 / R_3 \quad (2)$$

Thus,

$$I_2 = I_{IC} + 1.2 / R_3 \quad (3)$$

Therefore,

$$V_{OUT} = 1.2 + R_2 \times I_2 \quad (4)$$

Put Equation (3) into Equation (4), then

$$V_{OUT} = 1.2 + R_2 (I_{IC} + 1.2 / R_3)$$

$$= 1.2 (1 + R_2 / R_3) + R_2 \times I_{IC} \quad (5)$$

In 2nd term, or $R_2 \times I_{IC}$ will produce an error in V_{OUT} .

In Equation (5),

$$I_{IC} = 1.2 / R_{IC} \quad (6)$$

$$\begin{aligned} R_2 \times I_{IC} &= R_2 \times 1.2 / R_{IC} \\ &= 1.2 \times R_2 / R_{IC} \end{aligned} \quad (7)$$

For better accuracy, choosing $R_2 (<< R_{IC})$ reduces this error.
